Overview

- Wm82.a2.v1 genome sequence
- Fast Neutron-induced indels and Transposable Element insertions
- SoySNP50K haplotypes
- SoyMap2 genome browser
- improved QTL names
- SoyBase and community-provided tutorials
- GWAS QTL

Comparison of Wm82.a1 and Wm82.a2 Genome Assemblies

New Wm82 genome assembly from JGI

- corrects known problems with the v1 assembly
- incorporates additional transcript data resulting in improved gene predictions
- revised gene model and annotation nomenclature

locus: **Glyma.01g000100**

transcript: **Glyma.01g000100.1**

for annotation version Wm82.a2.v1

locus ID: **Glyma.01g000100.Wm82.a2.v1**

transcript ID: **Glyma.01g000100.1.Wm82.a2.v1**

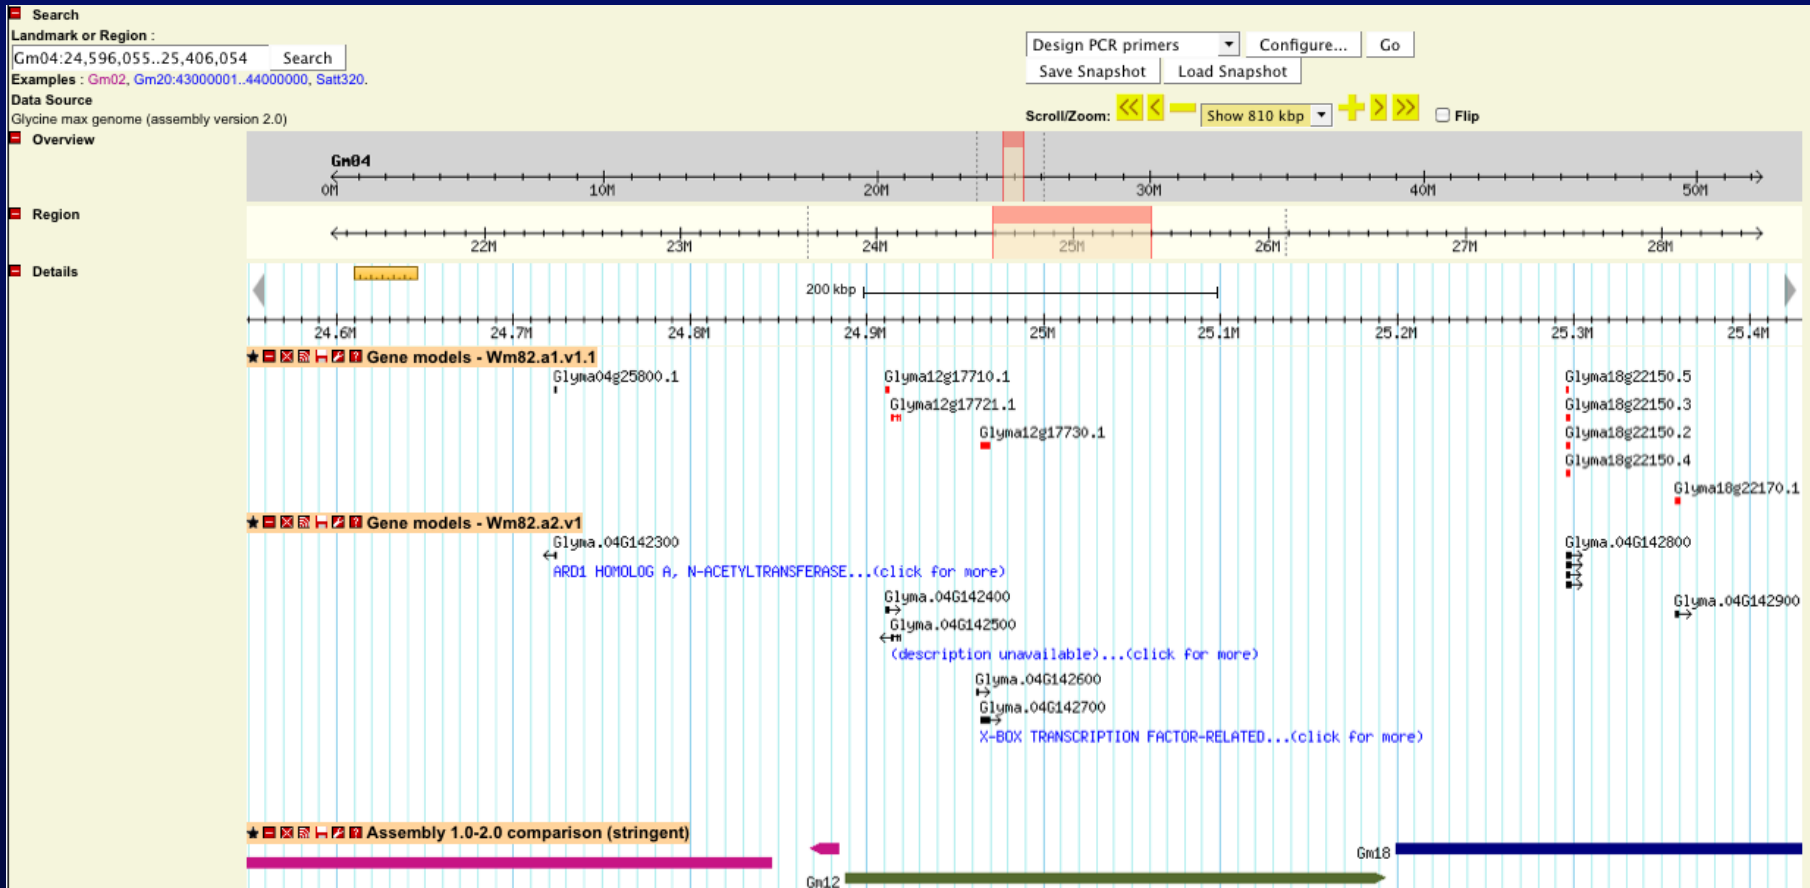

The current sequence browser now has a track showing synteny between the v1 and v2 assemblies.

The v1 and v2 synteny tracks are reciprocal for shared regions.

Wm82.a1.v1.1 gene models and markers mapped onto new assembly when possible.

Markers and gene models with different chromosomal locations or DNA strand between the two assemblies are indicated in red.

Sample Information

Mutant Name FN0110332
Genus species Glycine max
Cultivar M92-220
Seed Availability Unknown
Experiment ID FN1.09
Laboratory USDA-ARS & UMN: Bolon/Vance
Mutagen fast neutron
Mutagenesis Date 9/2008

Genomic Analysis

SoySNP50K iSelect BeadChip

An Illumina Infinium BeadChip containing over 50,000 SNPs from soybean (*Glycine max* L. Merr.) has been developed (Song et al. 2013). A total of 498,921,777 reads 35-45 bp in length were obtained from DNA sequence analysis of reduced representation libraries from several soybean accessions which included six cultivated and two wild soybean (*G. soja* Sieb. et Zucc.) genotypes. These reads were mapped to the [soybean whole genome sequence](#) and 209,903 SNPs were identified. After applying several filters, a total of 146,161 SNPs were determined to be candidates for Illumina Infinium II BeadChip design. To equalize the distance between selected SNPs, increase assay success rate, and minimize the number of SNPs with low minor allele frequency, an iteration algorithm based on a selection index was developed and used to select 60,800 SNPs for Infinium BeadChip design. Of the 60,800 SNPs, 50,701 were targeted to euchromatic regions and 10,000 to heterochromatic regions of the 20 soybean chromosomes. In addition, 99 SNPs were targeted to unanchored sequence scaffolds. Of the 60,800 SNPs, a total of 52,041 passed Illumina's manufacturing phase to produce the SoySNP50K iSelect BeadChip. Validation of the SoySNP50K chip with 96 landrace genotypes, 96 elite cultivars and 96 wild soybean accessions showed that 47,337 SNPs were polymorphic and generated successful SNP allele calls. In addition, 40,841 of the 47,337 SNPs (86%) had minor allele frequencies >10% among the landraces, elite cultivars and the wild soybean accessions.

Search SoyBase for a specific SoySNP50K SNP

Examples: [ss715578909](#) or [BARC_1.01_Gm01_29091115_A_G](#)

Note: Searches covering the original BARC SNPs can be done on [this page](#).

View SoySNP50K SNPs in SoyBase Genome Browser

Download SNP Data

The SoySNP50K iSelect BeadChip has been used to genotype the USDA [Soybean Germplasm Collection](#) (Song et al. in preparation) and the data generously provided by the authors before publication. The complete data set for 19,652 *G. max* and *G. soja* accessions genotyped with 52,041 SNPs is available [here](#) (approx. 170 Mb compressed with GZIP) .

SoySNP50K haplotypes for a user-selected subset of the genotyped cultivars can be downloaded from [this page](#).

Download SoySNP50K haplotypes for a subset of the cultivars

Paste a list of cultivar names, one per line, into the box below or use the Browse button to navigate to a plain text file on your computer that contains a list of cultivar names.

The submit button will initiate a download to your computer of the SoySNP50K haplotypes for the cultivars you provide.

Or use our [shopping cart](#) tool to select cultivars of interest from the complete list of cultivars haplotyped by Song et al.

Readme Text:

(Included in download)

Including this READ ME there are four files returned for a cultivar-haplotype search. All data are in plain text files with tab delimiters between columns.

NOTE:

We have observed that on some computers opening these files directly in Excel results in each line being placed in a single cell rather than 1 cell per tab-separated column. This can be solved by opening the file in Word or another text editor and using copy/paste to put the data into Excel.

Downloaded Data Files:

cultivar_snps

This is a 2 column tab-delimited file, 1 line per cultivar.

| Cultivar Name | Cultivar Haplotype |
|---------------|----------------------------------|
| PI442007B | TAATTAATAAGTAGTAATAACCCAGGA..... |

snp_id_and_position

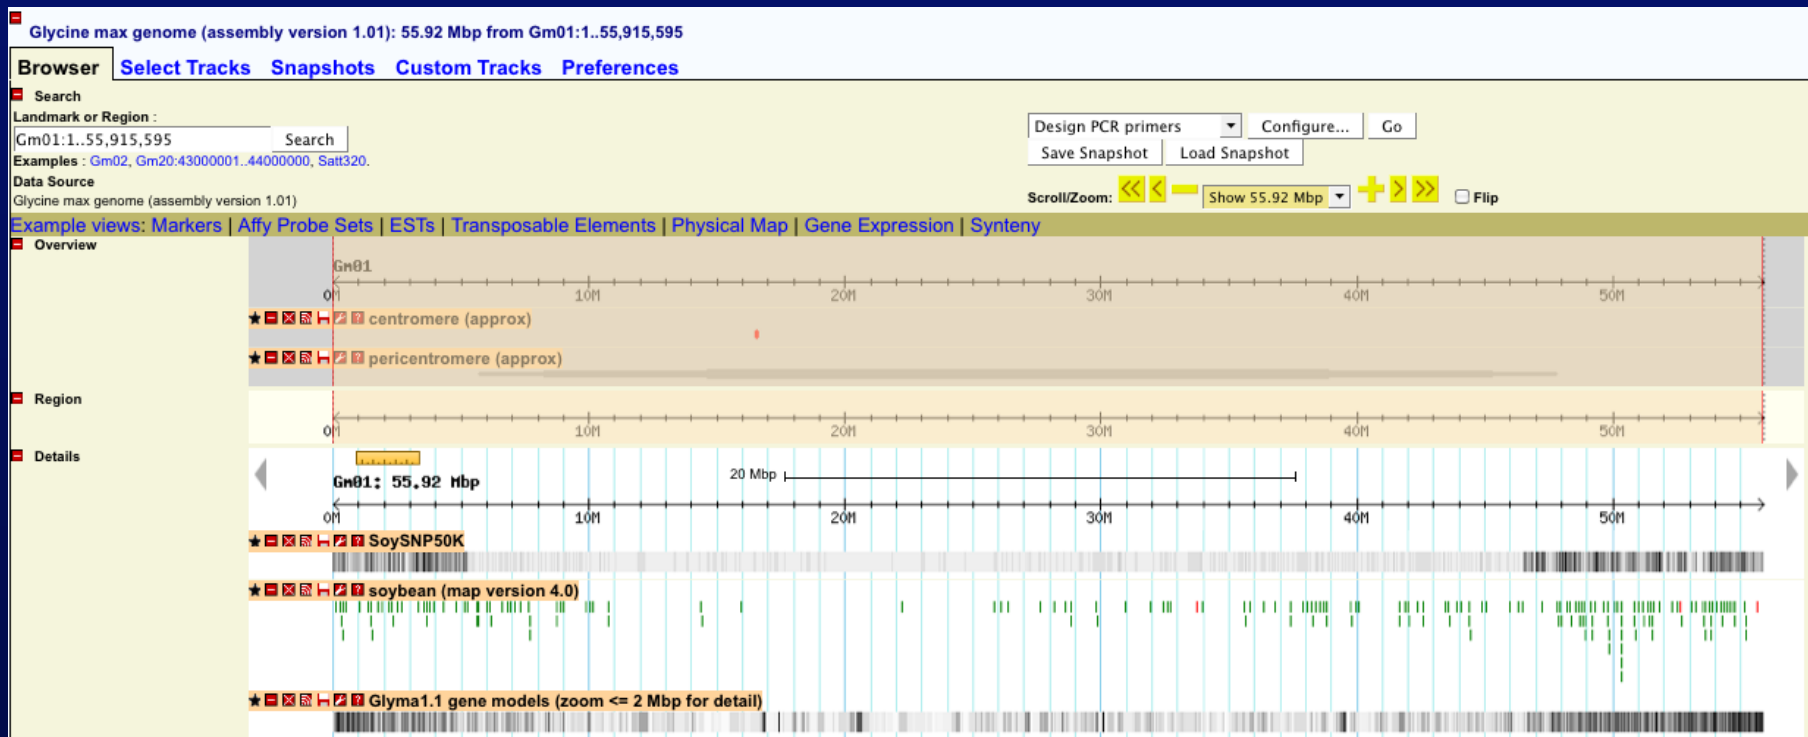

This file contains what amounts to the column header information for 'cultivar_snps'. It is provided as a separate file so that the haplotype data in 'cultivar_snps' doesn't need to have tabs between each SNP allele value.

| SNP Name | ss715578401 | ss715578402 | ss715578403 | ss715578404 | ss715578405 |
|------------|-------------|-------------|-------------|-------------|-------------|
| Chromosome | Gm01 | Gm01 | Gm01 | Gm01 | Gm01 |
| Position | 10015701 | 10052330 | 1006696 | 10074809 | 1009248 |

snp_id_position_and_value

This is a more human readable version that includes both the haplotype data and the SNP descriptions. The order of SNP lines is the same as the order of SNP allele values in 'cultivar_snps'.

| SNP ID | Chromosome | Position | PI442007B | PI365426 | PI587703A | PI228064 |
|-------------|------------|----------|-----------|----------|-----------|----------|
| ss715578401 | Gm01 | 10015701 | A | A | A | A |
| ss715578402 | Gm01 | 10052330 | C | C | C | C |

SoySNP50K data currently only on genome assembly Wm82.a1.v1.1 (Wm82.a2.v1 coming soon).

SoyMap2 Diversity Browser

About

The resources below are part of the NSF project **SoyMap II: Leveraging untapped genetic diversity in soybean**, 0822258-DFBI. This project is determining important parts of the genome sequences of seven wild relatives of soybean, in order to better understand how these wild relatives have been able to adapt to the harsh conditions where they grow - and to understand how this group of species has evolved over the several million years since they separated from their common ancestor.

This page gives access to the survey sequencing from the project, and to the twelve focus regions in the project, which are being sequenced and studied in detail. Also please see these project sites: [Hudson-Alpha Institute sequencing](#), [Project resources for download](#), and [Project outreach](#).

[More about the resources on this page]

Example configurations

- Main BAC-end tracks; assembly v. 1; Gm03, 1 Mb window.
- Main BAC-end tracks; assembly v. 2; Gm03, 1 Mb window.
- Main BAC-end tracks; assembly v. 1; Gm02 entire; with exon and repeat densities.
- Main BAC-end tracks; assembly v. 2; Gm02 entire; showing correspondence between assembly versions.
- "Long" BAC-end tracks; assembly v. 1; Gm11 entire; with likely rearrangements among species.
- BAC-end tracks on assembly v. 2; Gm11 entire; showing rearrangements between assemblies 1 and 2.

Data repository for this project

All publicly-available data for this project are at http://soybase.org/data_distribution/soymap/ along with sequence- and alignment statistics, and methods. Additional data for this project will be available later in 2014, including assembled sequences for the "Regions of Interest", and transcriptome assemblies for each species.

Regions of Interest - assembly v1.0

General Opinion of SoyBase

- Generally Positive (SoyBase is easy to use and has the tools and data I need.)
- Generally Neutral (SoyBase has most of the tools and data I need but I have to search for them.)
- Generally Negative (SoyBase does not have the tools and data I need and is hard to understand.)

What is the best or most useful part of SoyBase?

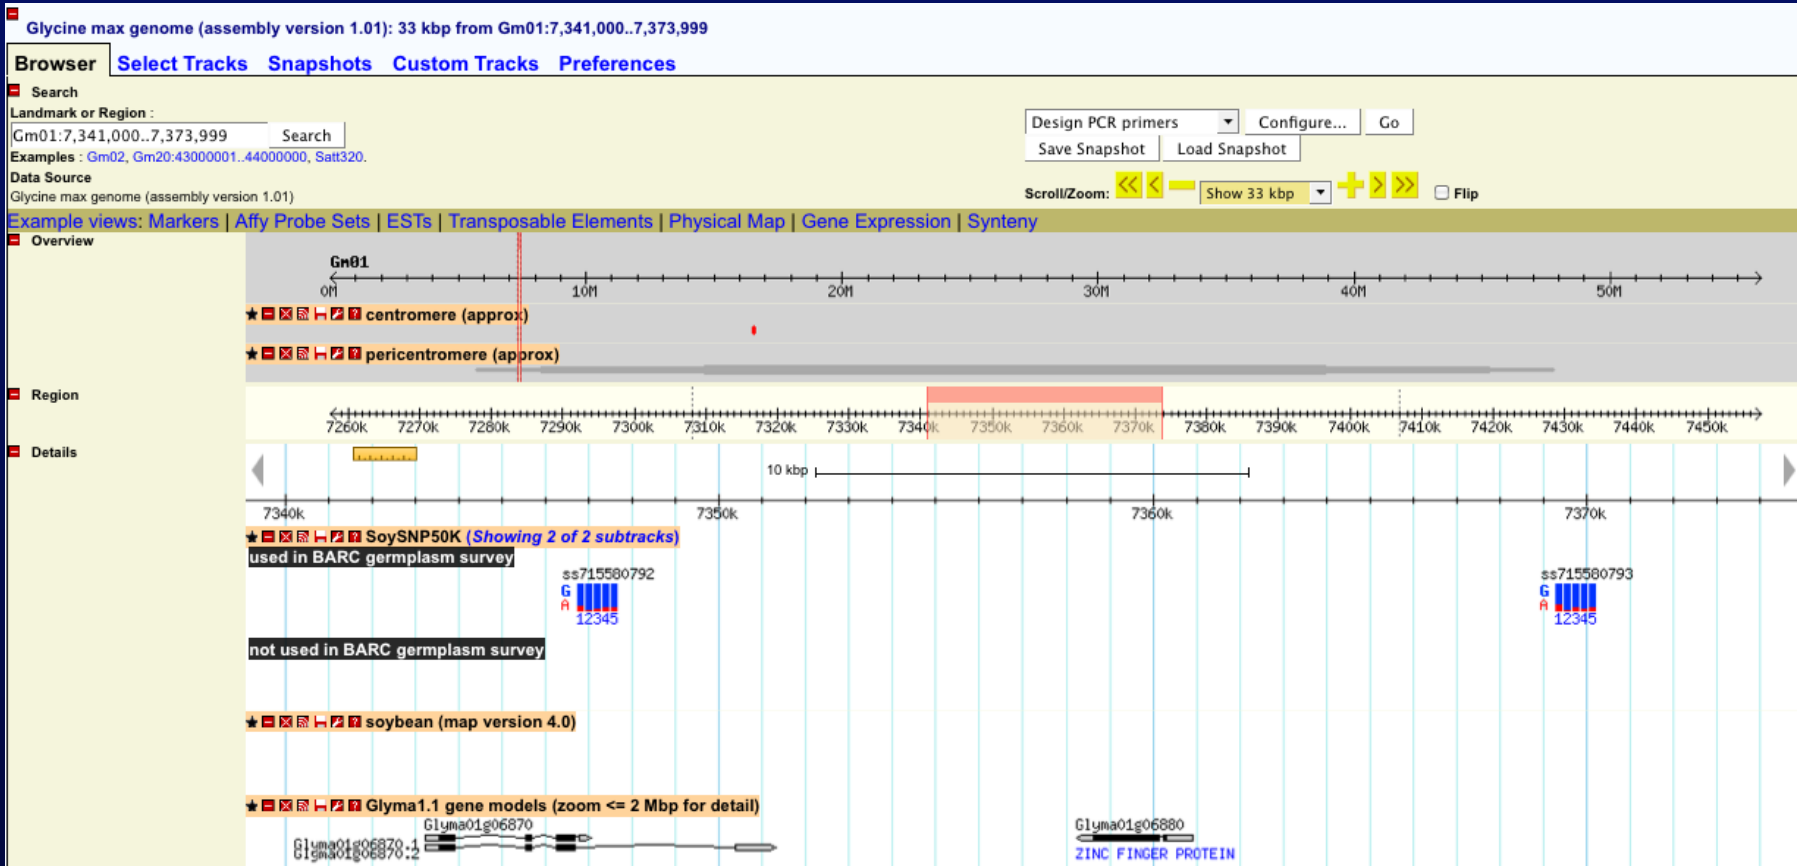

Please take the SoyBase survey
