

Outline

- Finding a market need
- Defining a desirable meal characteristic
- Breeding a specialized soybean

Leading Aquaculture Producing Countries

Countries	Production, metric tons (2006)
China	34,429,122
India	3,123,135
Viet Nam	1,657,727
Thailand	1,385,801
Indonesia	1,292,899
Bangladesh	892,049
Chile	802,410
Japan	733,891
Norway	708,780
Philippines	623,369
United States	~500,000

Fish Meal

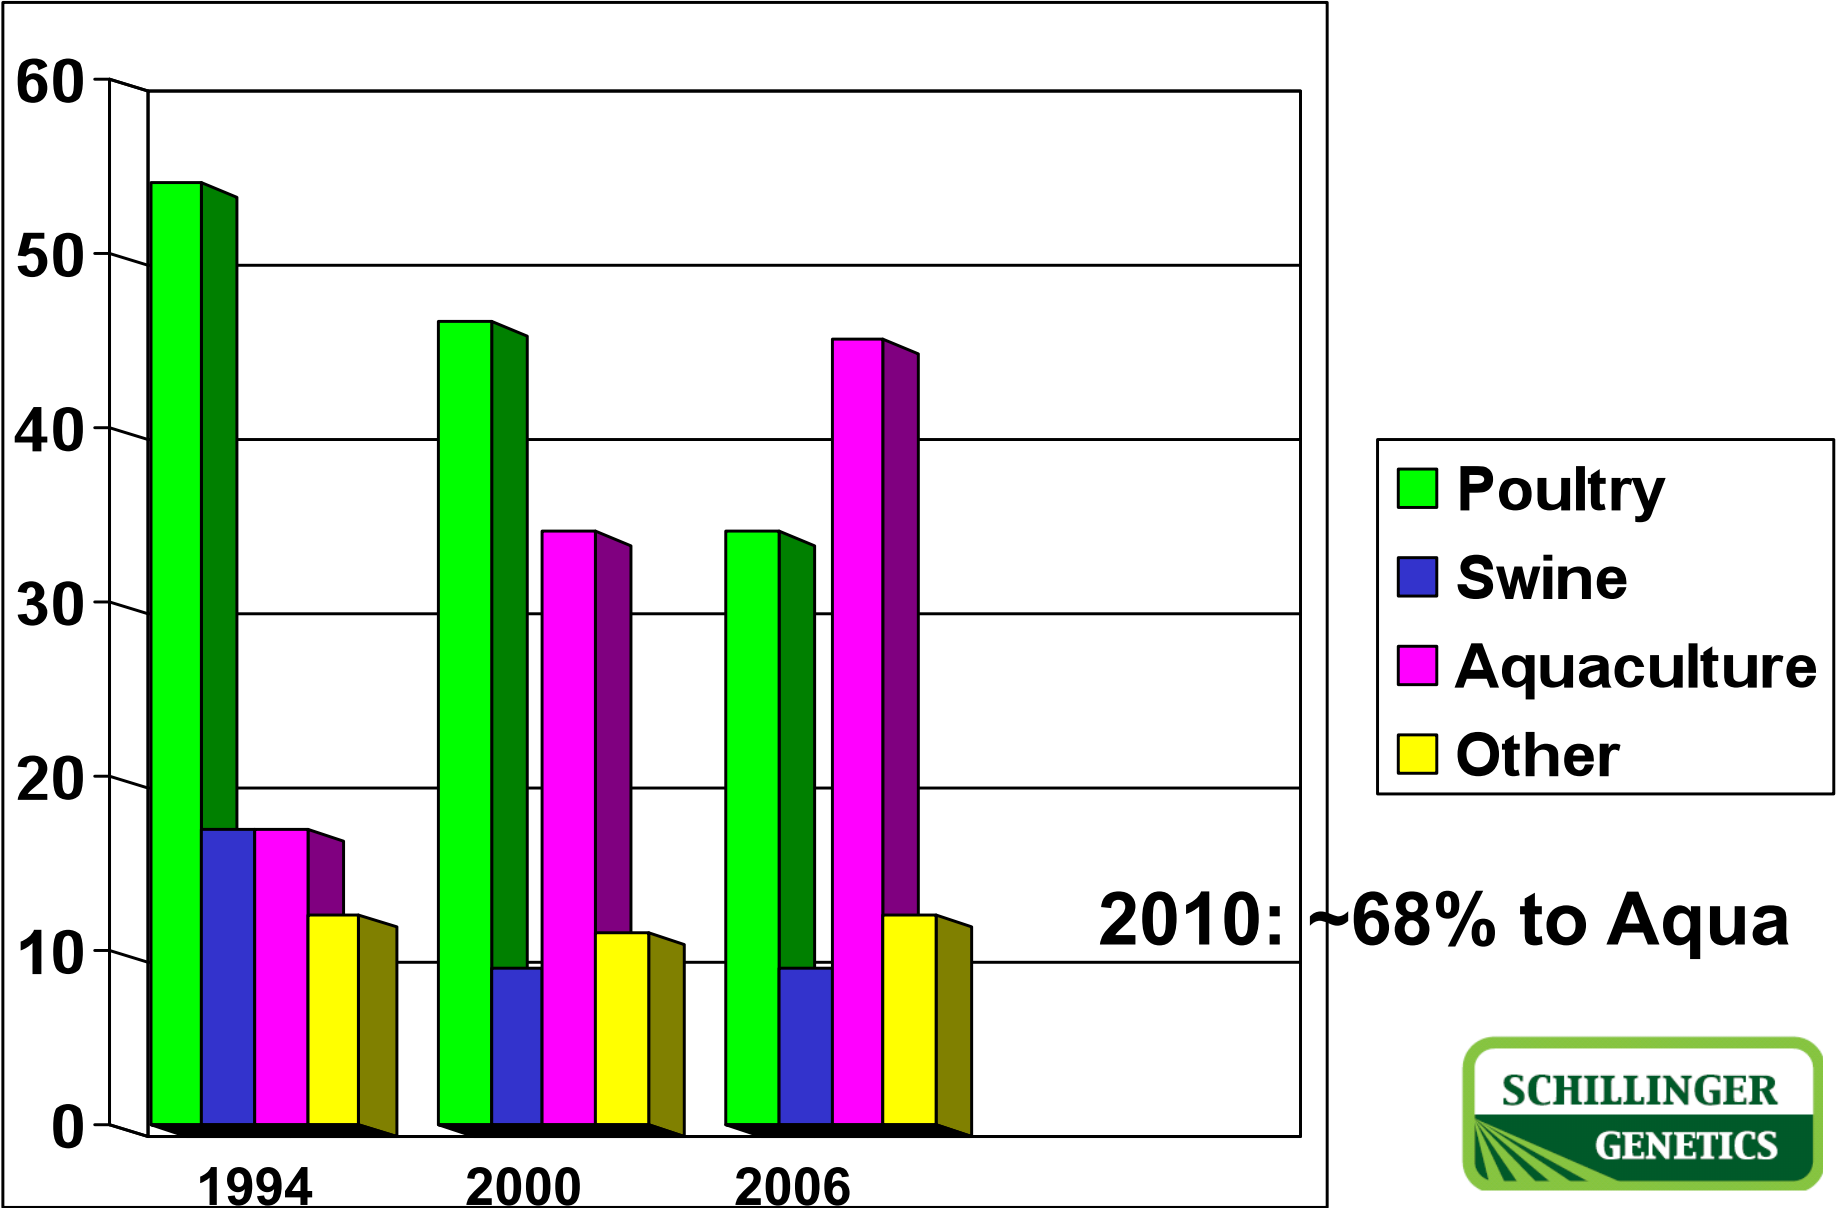

Capture fishery:

- herring, sardine, menhaden, anchovy etc.

Reasons for inclusion:

- Abundant
- Cheap on protein unit basis
- Very palatable
- Fish grow very fast

World fish meal use in livestock and fish feeds

Annual fish meal production from 1961 to 2000

Fishmeal and Soymeal prices (USD/mt)

Ingredient Evaluation

1) Compositional analysis

- Nutrients; protein, energy, amino acids, fatty acids, etc.
- Anti-nutrients; evolved in protective or developmental roles

2) Palatability

- Effect on feed intake

3) Digestibility

- Apparent Digestibility Coefficients

4) Functionality

- durability, expansion, oil absorption, water stability

5) Growth

- gain, FCR, fecal prod. product quality
- laboratory, pilot scale, 3rd party, production scale

Soybean Seed Composition

Carbohydrates and Nutrition

Gastricenteritis

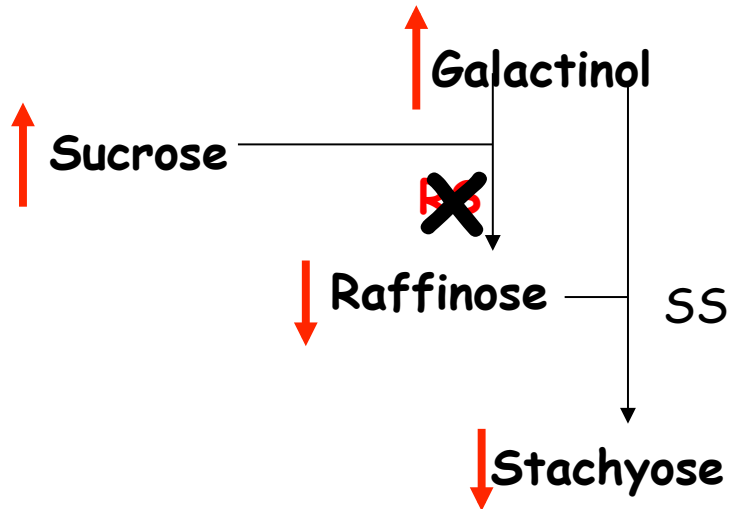

Digestion of raffinose and stachyose by micro-organisms in the gut leads to flatulence, diarrhea and poor weight gain...and gastricenteritis.

Healthy intestines

Biochemical Pathway for Raffinose, and Stachyose Production

HPLC: Phenotypic Measurement

Average Soybean

Low RS soybean

Sucrose

Raffinose Stachyose

Soybean Breeding Strategy

- Utilize Molecular Markers targeted to RS genes
- Select plants/seed with favorable oligosaccharide phenotypes verified by HPLC
- Market soybeans with specialized traits for digestibility

Questions and Discussion
